

Introduction to Argilla

In Chapter 5, you learned how to build a dataset using the Datasets library, and in Chapter 6, you explored how to fine-tune models for some common NLP tasks. In this chapter, you will learn how to use Argilla to annotate and curate datasets, which you can use to train and evaluate your models.

The key to training models that perform well is high-quality data. Although there are some good datasets available on the Hub that you can use to train and evaluate your models, they may not be relevant to your specific application or use case. In this situation, you may want to build and curate your own dataset. Argilla will help you do this efficiently.

With Argilla, you can:

- Turn unstructured data into structured data for use in NLP tasks.
- Curate a dataset to move from a low-quality dataset to a high-quality dataset.
- Collect human feedback for LLMs and multi-modal models.
- Invite experts to collaborate with you in Argilla, or crowdsource annotations.

In this chapter, you will learn:

- How to set up your own Argilla instance.

- How to load a dataset and configure it based on some popular NLP tasks.
- How to use the Argilla UI to annotate your dataset.
- How to use your curated dataset and export it to the Hub.
