

The web interface offers tools to manage repositories directly in the Hub. Using the interface, you can easily create repositories, add files (even large ones!), explore models, visualize diffs, and much more.

To create a new repository, visit huggingface.co/new:

The screenshot shows the 'Create a new model repository' page. At the top is the Hugging Face logo (a blue cube). Below it is the title 'Create a new model repository' and a subtitle 'A repository contains all model files, including the revision history.' The form has several sections: 1. 'Owner' and 'Model name' fields. The 'Owner' field is a dropdown menu with 'Sakhawathossen' selected. The 'Model name' field contains 'dummy_model'. 2. A 'License' dropdown menu with 'License' selected. 3. A 'Base template' dropdown menu with a plus icon and 'Base template' selected. 4. Two radio button options for visibility: 'Public' (selected) and 'Private'. The 'Public' option has a description: 'Anyone on the internet can see this model. Only you (personal model) or members of your organization (organization model) can commit.' The 'Private' option has a description: 'Only you (personal model) or members of your organization (organization model) can see and commit to this model.' 5. A light blue informational box stating: 'Once your model is created, you can upload your files using the web interface or git.' 6. A 'Create model' button at the bottom.

Create a new model repository
A repository contains all model files, including the revision history.

Owner: Sakhawathossen / Model name: dummy_model

License: License

Base template: Base template

☒ **Public**
Anyone on the internet can see this model. Only you (personal model) or members of your organization (organization model) can commit.

☐ **Private**
Only you (personal model) or members of your organization (organization model) can see and commit to this model.

Once your model is created, you can upload your files using the web interface or git.

Create model

First, specify the owner of the repository: this can be either you or any of the organizations you're affiliated with. If you choose an organization, the model will be featured on the organization's page and every member of the organization will have the ability to contribute to the repository.

Next, enter your model's name. This will also be the name of the repository. Finally, you can specify whether you want your model to be public or private. Private models are hidden from public view.

After creating your model repository, you should see a page like this:

This is where your model will be hosted. To start populating it, you can add a README file directly from the web interface.

The README file is in Markdown — feel free to go wild with it! The third part of this chapter is dedicated to building a model card. These are of prime importance in bringing value to your model, as they’re where you tell others what it can do.

If you look at the “Files and versions” tab, you’ll see that there aren’t many files there yet — just the *README.md* you just created and the *.gitattributes* file that keeps track of large files.
