

Set up your Argilla instance

To start using Argilla, you first need to set up your own Argilla instance. After that, you need to install the Python SDK so that you can manage Argilla using Python code.

Deploy the Argilla UI

The easiest way to set up your Argilla instance is by using Hugging Face Spaces.

To create your Argilla Space, follow this form. If you need further help, check the Argilla quickstart.

Create a new Space

[Spaces](#) are Git repositories that host application code for Machine Learning demos.

You can build Spaces with Python libraries like [Gradio](#), or using [Docker images](#).

Select the Space SDK

You can choose between [Gradio](#), [Docker](#), or [Static](#) to host your Space.

Gradio

4 templates

NEW

Docker

17 templates

Static

6 templates

Choose a Gradio template:

Space configuration form

Warning: You may want to enable Persistent storage so that your data is not lost if the Space is paused or restarted. You can enable this from the Settings of your Space.

Once Argilla is up and running, you can log in using your credentials.

Install and connect the Python SDK

Now you can go to your Python environment or notebook and install the argilla library:

```
!pip install argilla
```

Next, you need to connect to your Argilla instance. For that, you will need the following information:

- **Your API URL:** This is the URL where Argilla is running. If you are using a Space, open the Space, click on the three dots in the top right corner, then select “Embed this Space” and copy the Direct URL. It should look something like:
https://...hf.space
- **Your API key:** To get this, log in to your Argilla instance, go to “My Settings”, and copy the API key.
- **Your HF token:** If your Space is private, you will need an Access Token in your Hugging Face Hub account with writing permissions.

```
import argilla as rg
```

```
HF_TOKEN = "..." # only for private spaces
```

```
client = rg.Argilla(  
    api_url="...",  
    api_key="...",  
    headers={"Authorization": f"Bearer {HF_TOKEN}"}, # only for private spaces  
)
```

To check if everything is working properly, we will call `me`. This should return your user information:

```
client.me
```

If this works, then your Argilla instance is up and running and you are successfully connected. Congratulations!

Now you can start loading your first dataset into Argilla.
